Appendix H = Percolation Test Data

## **METHODOLOGY**

Brooker Engineering, PLLC has been retained to perform a hydraulic and hydrologic analysis for the Rella Boulevard project to provide zero-net increase in peak runoff rates as a result of the proposed development.

The project site is Tax Lots 55.08-1-5 & 6 and has a total area of 18.5265 acres situated in the LO-C zoning district. The proposed development of the property includes four (4) warehouse/flex-space buildings totaling 236,860 SF with 156 parking spaces having access from Rella Boulevard.

The lots are currently vacant and heavily wooded. The site drains in two (2) directions: South to a network of catch basins in Rella Boulevard, and West to a network of catch basins in Airmont Road.

According to the U.S. Department of Agriculture Soil Conservation Service, the soil on-site consists mainly of Creshire gravelly fine sandy loam, 2 to 8 percent slopes (87.9%), and of Wethersfield gravelly silt loam, 8 to 15 percent slopes (12.1%).

The attached Existing Conditions Drainage Area Map shows the project site divided into two (2) drainage areas, draining to separate points of interest. Drainage Area #1 drains to Point of Interest #1 at the network of catch basins in Rella Boulevard. Drainage Area #2 drains to Point of Interest #2 at the network of catch basins in Airmont Road.

The attached Proposed Conditions Drainage Area Map also shows the project site divided into two (2) drainage areas. Drainage Area #1 is further broken down into Drainage Area #1A, Drainage Area #1B, and Drainage Area #1C. Drainage Area #1A is captured in the proposed underground infiltration system under Roadway C. Drainage Area #1C is captured in the proposed underground infiltration system under Roadway B. Drainage Area #1C drains to the network of catch basins in Rella Boulevard, as in existing conditions. Drainage Area #2 is further broken down into Drainage Area #2A and Drainage Area #2B. Drainage Area #2A is captured in the proposed infiltration basin. Drainage Area #2B drains to the network of catch basins in Airmont Road, as in existing conditions.

For Drainage Area #1A, the developed, impervious portion of the land (consisting of buildings/roofs, pavement, sidewalks, and 62% of the emergency access road) is captured in a network of catch basins along Roadway C, and routed to the proposed underground infiltration system underneath Roadway C. For Drainage Area #1C, the developed, impervious portion of the land (consisting of buildings/roofs, pavement, sidewalks, and 62% of the emergency access road) is captured in a network of catch basins along Roadway B, and routed to the proposed underground infiltration system underneath Roadway B. For Drainage Area #2A, the developed, impervious portion of the land (consisting of buildings/roofs, pavement, sidewalks, and 62% of the emergency access road) runs through a network of catch basins underneath Roadways A and D to the proposed infiltration basin. The infiltration basins have been designed and sized to handle the runoff from a 100-year storm.

Proposed Stormwater Management Facilities have been designed to provide water quality and quantity controls utilizing standard practices in accordance with the requirements of the New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit for Stormwater Discharges from Construction. The design incorporates sizing for:

- 1) Water Quality Volume Control (WQv),
- 2) Runoff Reduction Volume (RRv),
- 3) Channel Protection Storage Volume (CPv),
- 4) Overbank Flood Control (Qp) and
- 5) Extreme Storm Flood Control (Qf).

These five components of the water quality sizing criteria are further described as follows:

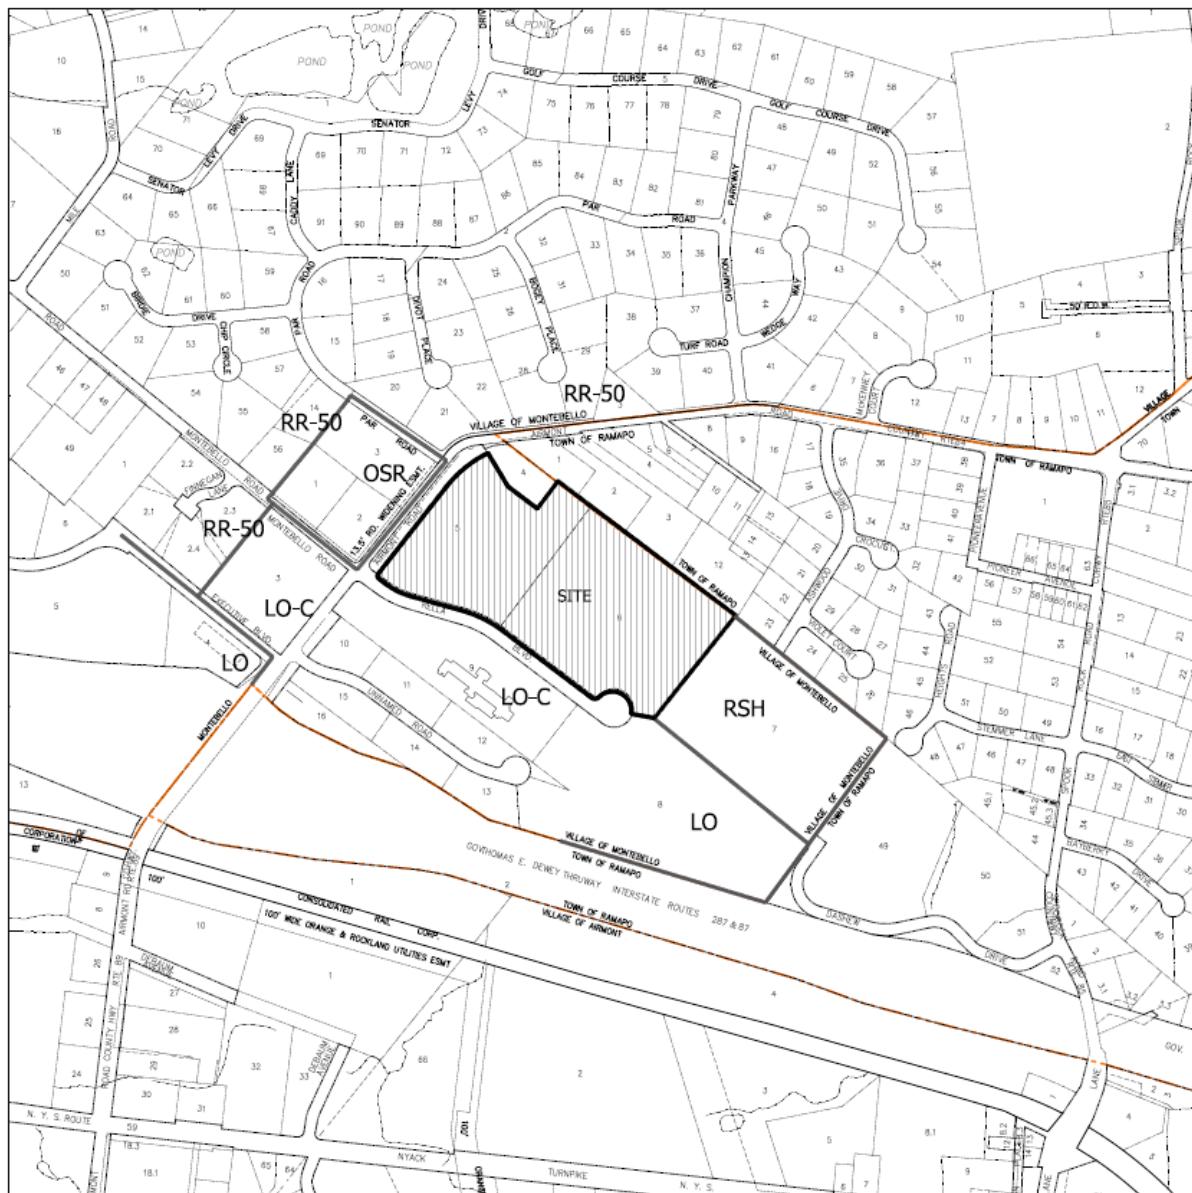

- The Water Quality Volume (WQv) is designed to improve water quality by capturing and treating 90% of the average annual stormwater runoff volume. The WQv is directly related to the amount of impervious cover on a project site. On this project the water quality volume will be treated by the use of the underground infiltration facilities.
- The Runoff Reduction Volume (RRv) is designed to control post-development water quality volumes to replicate pre-development hydrology by maintaining pre-construction infiltration, peak runoff flow, and discharge volume as well as minimizing concentrated flow. Runoff Reduction is achieved by infiltration, groundwater recharge, reuse and recycling by incorporating green infrastructure techniques and standard stormwater management practices with runoff reducing capacity.
- The Channel Protection Storage Volume (CPv) is designed to protect stream channels from erosion. The CPv is accomplished by providing 24 hour extended detention of the one-year, 24-hour storm event.
- The purpose of Overbank Flood Control (Qp) is to prevent an increase in the frequency and magnitude of out-of-bank flooding generated by urban development. Overbank Flood Control is accomplished by attenuating the post development 10-year, 24-hour peak discharge rate from the site to the pre-development rate.
- The purpose of Extreme Flood Control (Qf) is to prevent an increased risk of flood damage from large storm events, to maintain the boundaries of the pre-development 100-year floodplain, and to protect the physical integrity of stormwater management practices. Extreme Flood Control is accomplished by attenuating the post development 100-year, 24-hour peak discharge rate from the site to the pre-development rate.

The required Water Quality Volume was calculated in accordance with the procedure outlined in the *New York State Stormwater Management Design Manual*. The 100% Runoff Reduction requirement is achieved by providing infiltration for the entire water quality volume. The Overbank Flood Control and Extreme Storm Flood Control are provided by controlling the peak discharge from the project site for the 10 year and 100-year storms to pre-development rates.

This hydrologic analysis utilized the HydroCAD computer program to generate, route and combine runoff hydrographs for storms having 1-, 2-, 10-, 25-, and 100-year recurrence intervals. Runoff hydrographs were generated by utilizing SCS hydrographs to match discharges as calculated using the TR-55 peak discharge method for each drainage subarea.

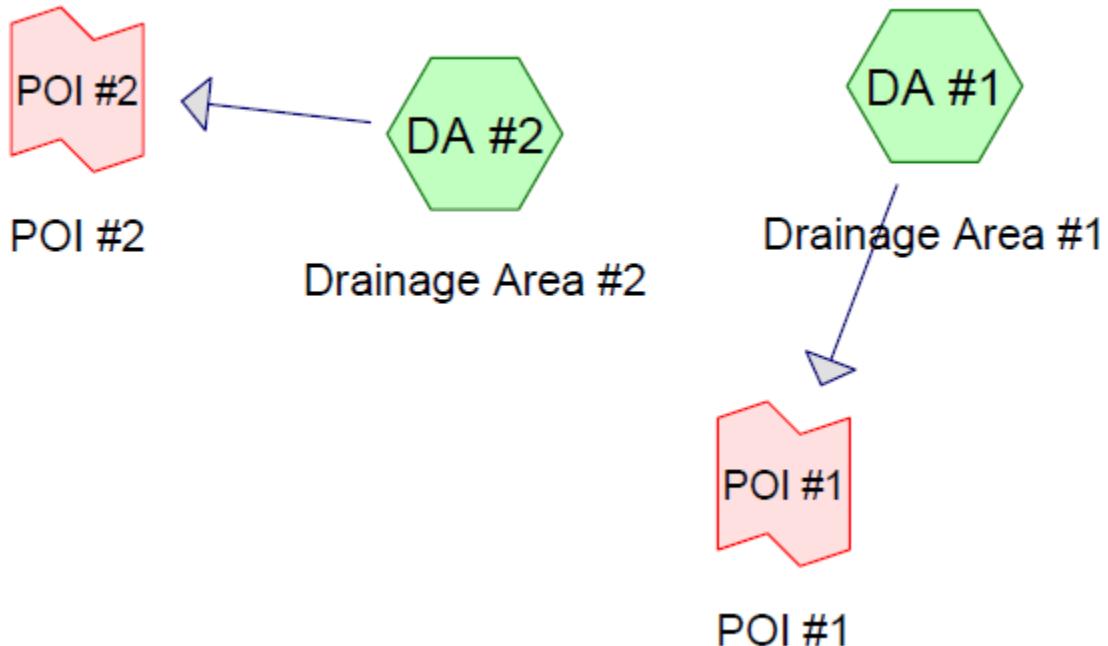

The attached tables summarize the results of the stormwater runoff analyses. Also attached are backup calculations, input data, and HydroCAD computer output.

## **Water Quality (WQv) Calculations**

Utilize the procedures outlined in Chapters 4 and Chapter 9 of NYSDEC Stormwater Management Design Manual

Compute Impervious Cover

### **Drainage Area to Roadway C Underground Infiltration Basin:**

Contributing site area = 3.795 acres

Impervious area to be treated = 3.497 acres

Impervious Cover (I) = 92.16%

Compute Runoff Coefficient

$$\begin{aligned} Rv &= 0.05 + (I)(0.009) \\ &= 0.05 + (92.16)(0.009) = 0.879 \end{aligned}$$

### **Compute Required Water Quality Volume (WQv)**

Use 90% Capture Rule

From Figure 4.1 of Stormwater Management Design Manual, 90% Rainfall = 1.5"

$$WQv = [(P)(Rv)(A)] / 12 = [(1.5")](0.879)(3.795)] / 12 = \underline{\textbf{0.417 acre-feet = 18,164 ft}^3}$$

The WQv = 18,164 cubic feet represents the required water quality volume *before* runoff reduction volume is considered. The WQv can be recalculated and reduced in accordance with the implementation of the Runoff Reduction measures.

### **Drainage Area to Roadway B Underground Infiltration Basin:**

Contributing site area = 3.516 acres

Impervious area to be treated = 3.277 acres

Impervious Cover (I) = 93.20%

Compute Runoff Coefficient

$$\begin{aligned} Rv &= 0.05 + (I)(0.009) \\ &= 0.05 + (93.20)(0.009) = 0.889 \end{aligned}$$

### **Compute Required Water Quality Volume (WQv)**

Use 90% Capture Rule

From Figure 4.1 of Stormwater Management Design Manual, 90% Rainfall = 1.5"

$$WQv = [(P)(Rv)(A)] / 12 = [(1.5")](0.889)(3.516) / 12 = \underline{\textbf{0.391 acre-feet = 17,032 ft}^3}$$

The WQv = 17,032 cubic feet represents the required water quality volume *before* runoff reduction volume is considered. The WQv can be recalculated and reduced in accordance with the implementation of the Runoff Reduction measures.

#### **Drainage Area to West Infiltration Basin:**

Contributing site area = 2.799 acres

Impervious area to be treated = 2.420 acres

Impervious Cover (I) = 86.47%

Compute Runoff Coefficient

$$\begin{aligned} Rv &= 0.05 + (I)(0.009) \\ &= 0.05 + (86.47)(0.009) = 0.828 \end{aligned}$$

#### **Compute Required Water Quality Volume (WQv)**

Use 90% Capture Rule

From Figure 4.1 of Stormwater Management Design Manual, 90% Rainfall = 1.5"

$$WQv = [(P)(Rv)(A)] / 12 = [(1.5")](0.828)(2.799)] / 12 = \underline{\underline{0.290 \text{ acre-feet} = 12,632 \text{ ft}^3}}$$

The WQv = 12,632 cubic feet represents the required water quality volume *before* runoff reduction volume is considered. The WQv can be recalculated and reduced in accordance with the implementation of the Runoff Reduction measures.

## **Minimum Runoff Reduction Volume (RRv)**

According to the NYSDEC Stormwater Management Design Manual, Runoff Reduction Volume (RRv) is a reduction of the total Water Quality Volume (WQv) by application of green infrastructure techniques and Standard Stormwater Management Practices (SMPs) to replicate pre-development hydrology. This concept is intended to improve the mitigation of the negative effects of stormwater runoff from development by incorporating the design and layout of stormwater management features into the site planning process. The three primary components that mitigate the negative effects of stormwater runoff are:

1. Avoiding Impacts – Avoid or minimize disturbance by preserving natural features and using conservation design techniques.
2. Reducing Impacts – Reducing the impacts of development by reducing impervious cover.
3. Managing Impacts – Manage the impacts by using natural features and runoff reduction practices to slow down the runoff, promote infiltration and minimize the need for structural “end-of-pipe” practices.

The RRv requirement can be accomplished by application of on-site green infrastructure techniques, standard stormwater management practices with runoff reduction capacity, and good operation and maintenance. The NYSDEC Stormwater Management Design Manual requires planners and designers to address this approach in an iterative site planning and design process. The iterative process is a five-step process that combines site planning with the use of various green infrastructure techniques and standard stormwater management practices until the RRv requirement is met. The iterative five-step process is as follows:

1. Site planning to preserve natural features and reduce impervious cover;
2. Calculation of the water quality volume for the site;
3. Incorporation of green infrastructure techniques and standard SMPs with RRv capacity;
4. Use of standard SMPs, where applicable; and
5. Design of volume and peak rate control practices where required.

If by using these techniques the calculated RRv is greater than the required WQv, the RRv requirement is met. If the RRv is less than the required WQv then the design must, at a minimum, reduce a percentage of the runoff from impervious areas to be constructed on the site. The percent reduction is based on the Hydrologic Soil Group of the site, and is determined by the Specific Reduction Factor (S). The Specific Reduction Factor (S) for this project is 0.40, based on the ‘B’ soils present.

The runoff reduction techniques that have been selected have been determined to be suitable for the proposed project in consideration of factors including site topography, slopes, soil properties, project layout, and maintenance requirements. The selected techniques include the following:

- Infiltration

## **Minimum Runoff Reduction Volume (RRv) Calculations**

Utilize the procedure outlined in Chapter 4, Section 4.3 of NYSDEC *Stormwater Management Design Manual*

### **Infiltration Calculations**

Two (2) underground infiltration systems, and one (1) infiltration basin will be installed to store, infiltrate and treat runoff from the site. The system has been sized to handle the runoff from the 100-year storm. A soil percolation rate of 12 inches per hour has been used based on test results.

Outlet control structures and outlet pipes are proposed from each system to the existing network of catch basins as in existing conditions.

#### **Drainage Area to Roadway C Infiltration System:**

The WQv storm was determined to be 1.83" of rainfall

Infiltration volume at WQv Peak Elevation (Elevation 492.53) = **0.418 acre-feet = 18,208 ft<sup>3</sup>**  
\*Outlet invert = Elevation 492.53

Infiltration practices count as 100% of WQv towards meeting the RRv sizing criteria.  
(Table 3.5 of the NYSDEC Stormwater Management Design Manual)

$$\text{RRv} = (1.0) \times (18,208 \text{ ft}^3) = 18,208 \text{ ft}^3$$

#### **Check 48-hour Infiltration**

12 inches per hour percolation rate.

$$12 \text{ in/hour} = 1 \text{ ft/hour}$$

$$\text{Bottom area of Roadway C Infiltration System (El. 491.75)} = 7,502 \text{ sq. ft.}$$

$$18,208 \text{ ft}^3 / 1 \text{ ft/hour} / 7,502 \text{ sq. ft.} = 2.43 \text{ hours} \rightarrow \text{OK}$$

#### **Drainage Area to Roadway B Infiltration System:**

The WQv storm was determined to be 1.85" of rainfall

Infiltration volume at WQv Peak Elevation (Elevation 496.04) = **0.393 acre-feet = 17,119 ft<sup>3</sup>**  
\*Outlet invert = Elevation 496.04

Infiltration practices count as 100% of WQv towards meeting the RRv sizing criteria.  
(Table 3.5 of the NYSDEC Stormwater Management Design Manual)

$$\text{RRv} = (1.0) \times (17,119 \text{ ft}^3) = 17,119 \text{ ft}^3$$

#### **Check 48-hour Infiltration**

12 inches per hour percolation rate.

12 in/hour = 1 ft/ hour

Bottom area of Roadway B Infiltration System (El. 495.25) = 6,909 sq. ft.

17,119 ft<sup>3</sup> / 1 ft/ hour / 6,909 sq. ft. = 2.48 hours < 48 hours → OK

#### **Drainage Area to Infiltration Basin:**

The WQv storm was determined to be 1.92" of rainfall

Infiltration volume at WQv Peak Elevation (Elevation 485.26) = **0.290 acre-feet = 12,632 ft<sup>3</sup>**

\*Outlet invert = Elevation 485.26

Infiltration practices count as 100% of WQv towards meeting the RRv sizing criteria.  
(Table 3.5 of the NYSDEC Stormwater Management Design Manual)

$$RRv = (1.0) \times (12,632 \text{ ft}^3) = 12,632 \text{ ft}^3$$

#### **Check 48-hour Infiltration**

12 inches per hour percolation rate.

12 in/hour = 1 ft/ hour

Bottom area of Infiltration Basin (El. 485.00) = 5,500 sq. ft.

12,632 ft<sup>3</sup> / 1 ft/ hour / 5,500 sq. ft. = 2.30 hours < 48 hours → OK

#### **Runoff Reduction Summary**

The entire water quality volume from the site will be treated, stored and infiltrated in the proposed systems. Therefore, the runoff reduction requirement of 100% is achieved.

## **POI Roadway C Underground Infiltration System**

An underground infiltration system is proposed to provide 100% water quality treatment and runoff reduction of Drainage Area #1A.

### **Storage Volume vs. Elevation per HydroCAD Output**

Elevation Storage Volume (cubic-feet)

498.50 (Top of Stone)	= 32,970 cf
497.50 (Top of Chamber)	= 30,100 cf
492.53 (Low Orifice)	= 2,439 cf
492.50 (Bottom of Chamber)	= 2,370 cf
491.75 (Bottom of Stone)	= 0 cf

### **Outlets**

### **Freeboard**

100-yr Peak WSEL = 501.43 (per attached HydroCAD analysis)

**Freeboard = 502.00' – 501.43' = 0.57'**

## **POI Infiltration Basin**

An infiltration basin is proposed to provide 100% water quality treatment and runoff reduction of Drainage Area #2A.

### **Storage Volume vs. Elevation per HydroCAD Output**

Elevation Storage Volume (cubic-feet)

485.00 (Bottom of Basin)	= 0 cf
486.00	= 6,500 cf
487.00	= 15,000 cf
488.00 (Top of Basin)	= 25,500 cf

### **Outlets**

- Exfiltration @ INV El. 485.00
- (1) 7" Diameter Orifice @ INV El. 485.26
- (1) 7" Diameter Orifice @ INV El. 486.79
- Emergency Spillway @ INV EL. 487.72

### **Freeboard**

100-yr Peak WSEL = 487.72 (per attached HydroCAD analysis)

**Freeboard = 488.00' – 487.72' = 0.28'**

## **Pretreatment**

According to the NYSDEC publication *Stormwater Management Design Manual*, the definition of Pretreatment is as follows:

**Pretreatment** – Techniques employed in stormwater SMPs to provide storage or filtering to help trap coarse materials before they enter the system.

In regard to pretreatment for infiltration practices, Section 6.3.3 of the NYSDEC *Stormwater Management Design Manual* states the following:

A minimum pretreatment volume of 25% of the WQv must be provided prior to entry to an infiltration facility, and can be provided in the form of a sedimentation basin, sump pit, grass channel, plunge pool or other measure.

Additionally, if the soil infiltration rate exceeds 5 inches per hour, a minimum pretreatment volume of 100% of the WQv must be provided.

In order to meet the pretreatment requirement, a *First Defense HC Stormwater Treatment Device* as manufactured by *Hydro International* has been selected. These devices are on the list of approved proprietary devices published by the New Jersey Corporation for Advanced Technology (NJCAT) and are thereby approved by the NYSDEC for use as pretreatment devices.

A *First Defense HC Stormwater Treatment Device* will be installed upstream of the inlet to proposed infiltration basins and underground infiltration system. The device is designed as flow-through device, and the selected sizing ensures that all water quality flows captured in the stormwater collection system will pass through the device prior to discharging into the stormwater infiltration system. Thus, the configuration provides pretreatment of the full water quality volume prior to it entering into the proposed stormwater infiltration system.

### **Pre-treatment Calculations:**

This system is designed as a flow-through device.

Conservation  
Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

# Custom Soil Resource Report for Rockland County, New York

# Preface

---

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (<http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/>) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (<https://offices.sc.egov.usda.gov/locator/app?agency=nrcs>) or your NRCS State Soil Scientist ([http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2\\_053951](http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951)).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

# How Soil Surveys Are Made

---

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units).

Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

## Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

## Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

# **Soil Map**

---

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

### MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Rockland County, New York

Survey Area Data: Version 18, Jun 11, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 22, 2020—Sep 23, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CrB	Cheshire gravelly fine sandy loam, 2 to 8 percent slopes	15.4	87.9%
WeC	Wethersfield gravelly silt loam, 8 to 15 percent slopes	2.1	12.1%
<b>Totals for Area of Interest</b>		<b>17.5</b>	<b>100.0%</b>

## Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however,

## Custom Soil Resource Report

onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

## Rockland County, New York

### CrB—Cheshire gravelly fine sandy loam, 2 to 8 percent slopes

#### Map Unit Setting

*National map unit symbol:* 9v46

*Elevation:* 50 to 670 feet

*Mean annual precipitation:* 47 to 50 inches

*Mean annual air temperature:* 48 to 52 degrees F

*Frost-free period:* 135 to 215 days

*Farmland classification:* All areas are prime farmland

#### Map Unit Composition

*Cheshire and similar soils:* 80 percent

*Minor components:* 20 percent

*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Cheshire

##### Setting

*Landform:* Till plains, hills

*Landform position (two-dimensional):* Summit

*Landform position (three-dimensional):* Crest

*Down-slope shape:* Convex

*Across-slope shape:* Convex

*Parent material:* Loamy till derived mostly from reddish sandstone, shale, and conglomerate

##### Typical profile

*H1 - 0 to 10 inches:* gravelly fine sandy loam

*H2 - 10 to 22 inches:* gravelly fine sandy loam

*H3 - 22 to 60 inches:* gravelly sandy loam

##### Properties and qualities

*Slope:* 3 to 8 percent

*Depth to restrictive feature:* More than 80 inches

*Drainage class:* Well drained

*Capacity of the most limiting layer to transmit water (Ksat):* Moderately high to high  
(0.57 to 5.95 in/hr)

*Depth to water table:* More than 80 inches

*Frequency of flooding:* None

*Frequency of ponding:* None

*Available water capacity:* Moderate (about 8.1 inches)

##### Interpretive groups

*Land capability classification (irrigated):* None specified

*Land capability classification (nonirrigated):* 2e

*Hydrologic Soil Group:* B

*Ecological site:* F145XY013CT - Well Drained Till Uplands

*Hydric soil rating:* No

#### Minor Components

##### Yalesville

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

**Wethersfield**

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

**Watchaug**

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

**Cheshire, very stony**

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

## WeC—Wethersfield gravelly silt loam, 8 to 15 percent slopes

**Map Unit Setting**

*National map unit symbol:* 9v5m  
*Elevation:* 20 to 690 feet  
*Mean annual precipitation:* 47 to 50 inches  
*Mean annual air temperature:* 48 to 52 degrees F  
*Frost-free period:* 135 to 215 days  
*Farmland classification:* Farmland of statewide importance

**Map Unit Composition**

*Wethersfield and similar soils:* 80 percent  
*Minor components:* 20 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

**Description of Wethersfield**

**Setting**

*Landform:* Till plains, hills  
*Landform position (two-dimensional):* Shoulder  
*Landform position (three-dimensional):* Crest  
*Down-slope shape:* Convex  
*Across-slope shape:* Convex  
*Parent material:* Loamy acid till derived mainly from reddish sandstone, shale, and conglomerate, with some basalt

**Typical profile**

*H1 - 0 to 13 inches:* gravelly silt loam  
*H2 - 13 to 22 inches:* gravelly loam  
*H3 - 22 to 60 inches:* gravelly fine sandy loam

**Properties and qualities**

*Slope:* 8 to 15 percent  
*Depth to restrictive feature:* 20 to 38 inches to densic material  
*Drainage class:* Well drained  
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)  
*Depth to water table:* About 18 to 30 inches  
*Frequency of flooding:* None

## Custom Soil Resource Report

*Frequency of ponding:* None

*Available water capacity:* Low (about 3.4 inches)

### Interpretive groups

*Land capability classification (irrigated):* None specified

*Land capability classification (nonirrigated):* 3e

*Hydrologic Soil Group:* C

*Ecological site:* F145XY012CT - Well Drained Dense Till Uplands

*Hydric soil rating:* No

### Minor Components

#### Cheshire

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Charlton

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Riverhead

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Wallington

*Percent of map unit:* 3 percent

*Hydric soil rating:* No

#### Yalesville

*Percent of map unit:* 2 percent

*Hydric soil rating:* No

# First Defense®

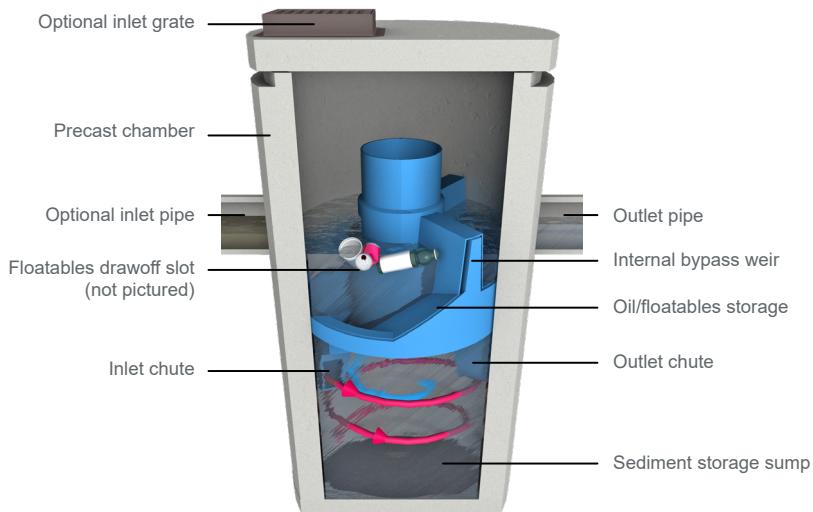

## Advanced Hydrodynamic Separator

### Product Summary

#### A Simple Solution for the Trickiest Sites

First Defense is a versatile stormwater separator with some of the highest approved flow rates in the United States. Engineers and contractors can save site space and reduce project costs by using the smallest possible footprint. It works with single or multiple inlet pipes and inlet grates. An internal bypass conveys infrequent peak flows directly to the outlet, efficiently capturing pollutants and preventing washouts.

### Features

Contaminated stormwater runoff enters the inlet chute from a surface grate and/or inlet pipe. The inlet chute introduces flow into the chamber tangentially to create a low energy vortex flow regime (**magenta arrow**) that directs sediment into the sump while oils, floating trash and debris rise to the surface.

Treated stormwater exits through a submerged outlet chute located opposite to the direction of the rotating flow (**blue arrow**). Enhanced vortex separation is provided by forcing the rotating

flow within the vessel to follow the longest path possible rather than directly from inlet to outlet.

Higher flows bypass the treatment chamber to prevent turbulence and washout of captured pollutants. An internal bypass conveys infrequent peak flows directly to the outlet eliminating the need for, and expense of, external bypass control structures. A floating draw off slot functions to convey floatables into the treatment chamber prior to bypass.

### Applications

- » Areas requiring a minimum of 50% TSS removal
- » Stormwater treatment at the point of entry into the drainage line
- » Sites constrained by space, topography or drainage profiles with limited slope and depth of cover
- » Highways, parking lots, industrial areas and urban developments
- » Pre-treatment to ponds, storage systems, green infrastructure

### Benefits

#### Highest Flow Through the Smallest Footprint

##### » Smaller Footprint, Lower Costs

First Defense provides space-saving, easy-to-install surface water treatment in standard size chambers/manholes.

##### » Adapt to Site Limitations

Variable configurations will help you effectively slip First Defense into a tight spot. It also works well with large pipes, multiple inlet pipes and inlet grates.

##### » Reduce Installation Time & Costs

Every First Defense unit is delivered to site pre-assembled and ready for install.

##### » Online System Configuration

First Defense eliminates the need for separate structures with its integrated internal bypass.

##### » Designed with Maintenance in Mind

Easy vector hose access through the center shaft of the system makes for quick sump cleanout, saving time and reducing long-term operational cost.

## Sizing & Specifications

First Defense units are available in **six diameters** to fit standard chamber and manhole sizes. The dimensions below are common across all model numbers.

Diameter	Peak Online Flow Rate	Maximum Pipe Diameter <sup>1</sup>	Typical Sediment Storage Capacity <sup>2</sup>	Minimum Distance from Outlet Invert to Top of Rim <sup>3</sup>	Standard Distance from Outlet Invert to Sump Floor
(ft / m)	(cfs / L/s)	(in / mm)	(yd <sup>3</sup> / m <sup>3</sup> )	(ft / m)	(ft / m)
3 / 0.9	15 / 424	18 / 450	0.4 / 0.3	2.0 - 2.5 / 0.61 - 0.76	3.71 / 1.13
4 / 1.2	18 / 510	24 / 600	0.7 / 0.5	2.0 - 3.0 / 0.61 - 0.91	4.97 / 1.5
5 / 1.5	20 / 566	24 / 600	1.1 / .84	2.0 - 3.7 / 0.61 - 1.13	5.83 / 1.5
6 / 1.8	32 / 906	30 / 750	1.6 / 1.2	2.0 - 4.1 / 0.61 - 1.25	5.97 / 1.8
8 / 2.4	50 / 1415	48 / 1200	2.8 / 2.1	2.4 - 5.4 / 0.73 - 1.65	7.40 / 2.2
10 / 3.0	50 / 1415	48 / 1200	4.4 / 3.3	2.4 - 6.8 / 0.73 - 2.07	10.25 / 3.12

Hydro International offers First Defense units in **two versions** that conform to the performance requirements of different states' water quality regulations.<sup>4</sup>

First Defense High Capacity Model Number	Typical TSS Treatment Flow Rates	
	NJDEP Certified <sup>4</sup>	110µm
	(cfs / L/s)	(cfs / L/s)
FDHC-3	0.84 / 23.7	1.06 / 30.0

# I. First Defense® by Hydro International

## Introduction

The First Defense® is an enhanced vortex separator that combines an effective and economical stormwater treatment chamber with an integral peak flow bypass. It efficiently removes total suspended solids (TSS), trash and hydrocarbons from stormwater runoff without washing out previously captured pollutants. The First Defense® is available in several model configurations to accommodate a wide range of pipe sizes, peak flows and depth constraints.

The two product models described in this guide are the First Defense® High Capacity and the First Defense® Optimum; they are inspected and maintained identically.

## Operation

The First Defense® operates on simple fluid hydraulics. It is self-activating, has no moving parts, no external power requirement and is fabricated with durable non-corrosive components. No manual procedures are required to operate the unit and maintenance is limited to monitoring accumulations of stored pollutants and periodic clean-outs. The First Defense® has been designed to allow for easy and safe access for inspection, monitoring and clean-out procedures. Neither entry into the unit nor removal of the internal components is necessary for maintenance, thus safety concerns related to confined-space-entry are avoided.

## Pollutant Capture and Retention

The internal components of the First Defense® have been designed to optimize pollutant capture. Sediment is captured and retained in the base of the unit, while oil and floatables are stored on the water surface in the inner volume (Fig.1).

The pollutant storage volumes are isolated from the built-in bypass chamber to prevent washout during high-flow storm events. The sump of the First Defense® retains a standing water level between storm events. This ensures a quiescent flow regime at the onset of a storm, preventing resuspension and washout of pollutants captured during previous events.

Accessories such as oil absorbent pads are available for enhanced oil removal and storage. Due to the separation of the oil and floatable storage volume from the outlet, the potential for washout of stored pollutants between clean-outs is minimized.

## Applications

- Stormwater treatment at the point of entry into the drainage line
- Sites constrained by space, topography or drainage profiles with limited slope and depth of cover
- Retrofit installations where stormwater treatment is placed on or tied into an existing storm drain line
- Pretreatment for filters, infiltration and storage

## Advantages

- Inlet options include surface grate or multiple inlet pipes
- Integral high capacity bypass conveys large peak flows without the need for "offline" arrangements using separate junction manholes
- Long flow path through the device ensures a long residence time within the treatment chamber, enhancing pollutant settling
- Delivered to site pre-assembled and ready for installation

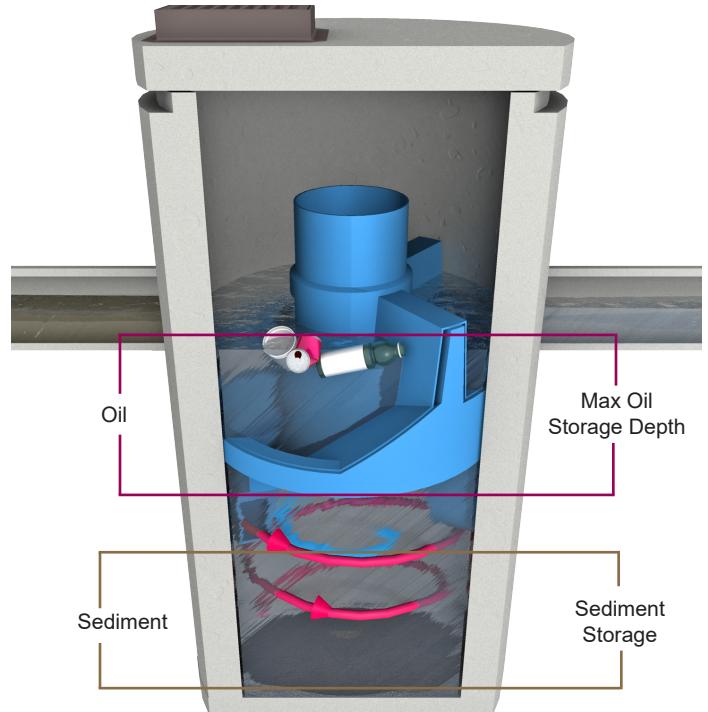

Fig.1 Pollutant storage volumes in the First Defense®.

## II. Model Sizes & Configurations

The First Defense® inlet and internal bypass arrangements are available in several model sizes and configurations. The components have modified geometries allowing greater design flexibility to accommodate various site constraints.

All First Defense® models include the internal components that are designed to remove and retain total suspended solids (TSS), gross solids, floatable trash and hydrocarbons (Fig.2). First Defense® model sizes (diameter) are shown in Table 1.

## III. Maintenance

10 / 3.0

## Overview

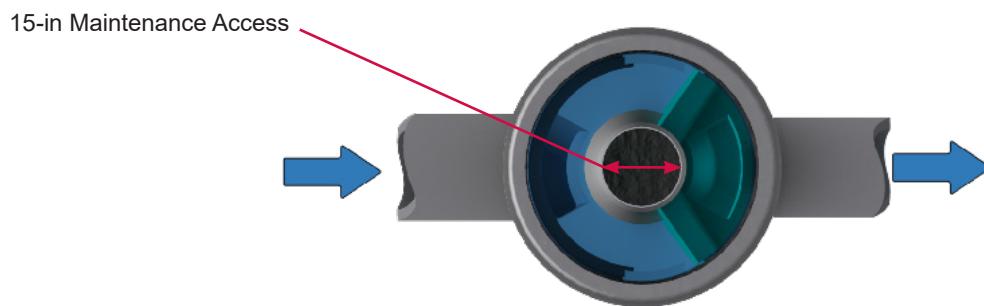

The First Defense® protects the environment by removing a wide range of pollutants from stormwater runoff. Periodic removal of these captured pollutants is essential to the continuous, long-term functioning of the First Defense®. The First Defense® will capture and retain sediment and oil until the sediment and oil storage volumes are full to capacity. When sediment and oil storage capacities are reached, the First Defense® will no longer be able to store removed sediment and oil.

The First Defense® allows for easy and safe inspection, monitoring and clean-out procedures. A commercially or municipally owned sump-vac is used to remove captured sediment and floatables. Access ports are located in the top of the manhole.

Maintenance events may include Inspection, Oil & Floatables Removal, and Sediment Removal. Maintenance events do not require entry into the First Defense®, nor do they require the internal components of the First Defense® to be removed. In the case of inspection and floatables removal, a vactor truck is not required. However, a vactor truck is required if the maintenance event is to include oil removal and/or sediment removal.

## Maintenance Equipment Considerations

The internal components of the First Defense® have a centrally located circular shaft through which the sediment storage sump can be accessed with a sump vac hose. The open diameter of this access shaft is 15 inches in diameter (Fig.3). Therefore, the nozzle fitting of any vactor hose used for maintenance should be less than 15 inches in diameter.

*Fig.3 The central opening to the sump of the First Defense® is 15 inches in diameter.*

## Determining Your Maintenance Schedule

The frequency of clean out is determined in the field after installation. During the first year of operation, the unit should be inspected every six months to determine the rate of sediment and floatables accumulation. A simple probe such as a Sludge-Judge® can be used to determine the level of accumulated solids stored in the sump. This information can be recorded in the maintenance log (see page 9) to establish a routine maintenance schedule.

The vactor procedure, including both sediment and oil / floatables removal, for First Defense® typically takes less than 30 minutes and removes a combined water/oil volume of about 765 gallons.

### **Inspection Procedures**

1. Set up any necessary safety equipment around the access port or grate of the First Defense® as stipulated by local ordinances. Safety equipment should notify passing pedestrian and road traffic that work is being done.
2. Remove the grate or lid to the manhole.
3. Without entering the vessel, look down into the chamber to inspect the inside. Make note of any irregularities. Fig.4 shows the standing water level that should be observed.
4. Without entering the vessel, use the pole with the skimmer net to remove floatables and loose debris from the components and water surface.
5. Using a sediment probe such as a Sludge Judge®, measure the depth of sediment that has collected in the sump of the vessel.
6. On the Maintenance Log (see page 9), record the date, unit location, estimated volume of floatables and gross debris removed, and the depth of sediment measured. Also note any apparent irregularities such as damaged components or blockages.
7. Securely replace the grate or lid.
8. Take down safety equipment.
9. Notify Hydro International of any irregularities noted during inspection.

### **Floatables and Sediment Clean Out**

Floatables clean out is typically done in conjunction with sediment removal. A commercially or municipally owned sump-vac is used to remove captured sediment and floatables (Fig.4).

Floatables and loose debris can also be netted with a skimmer and pole. The access port located at the top of the manhole provides unobstructed access for a vactor hose to be lowered to the base of the sump.

#### **Scheduling**

- Floatables and sump clean out are typically conducted once a year during any season.
- Floatables and sump clean out should occur as soon as possible following a spill in the contributing drainage area.

*Fig.4 Floatables are removed with a vactor hose*

#### **Recommended Equipment**

- Safety Equipment (traffic cones, etc)
- Crow bar or other tool to remove grate or lid
- Pole with skimmer or net (if only floatables are being removed)
- Sediment probe (such as a Sludge Judge®)
- Vactor truck (flexible hose recommended)
- First Defense® Maintenance Log

### **Floatables and Sediment Clean Out Procedures**

1. Set up any necessary safety equipment around the access port or grate of the First Defense® as stipulated by local ordinances. Safety equipment should notify passing pedestrian and road traffic that work is being done.
2. Remove the grate or lid to the manhole.
3. Without entering the vessel, look down into the chamber to inspect the inside. Make note of any irregularities.
4. Remove oil and floatables stored on the surface of the water with the vactor hose or with the skimmer or net
5. Using a sediment probe such as a Sludge Judge®, measure the depth of sediment that has collected in the sump of the vessel and record it in the Maintenance Log (page 9).
6. Once all floatables have been removed, drop the vactor hose to the base of the sump. Vactor out the sediment and gross debris off the sump floor
7. Retract the vactor hose from the vessel.
8. On the Maintenance Log provided by Hydro International, record the date, unit location, estimated volume of floatables and gross debris removed, and the depth of sediment measured. Also note any apparent irregularities such as damaged components, blockages, or irregularly high or low water levels.
9. Securely replace the grate or lid.

## **Maintenance at a Glance**

Inspection	<ul style="list-style-type: none"> <li>- Regularly during first year of installation</li> <li>- Every 6 months after the first year of installation</li> </ul>
Oil and Floatables Removal	<ul style="list-style-type: none"> <li>- Once per year, with sediment removal</li> <li>- Following a spill in the drainage area</li> </ul>
Sediment Removal	<ul style="list-style-type: none"> <li>- Once per year or as needed</li> <li>- Following a spill in the drainage area</li> </ul>
NOTE: For most clean outs the entire volume of liquid does not need to be removed from the manhole. Only remove the first few inches of oils and floatables from the water surface to reduce the total volume of liquid removed during a clean out.

**Re:** MTD Lab Certification  
First Defense® HC (FDHC) Stormwater Treatment Device by Hydro International

### **TSS Removal Rate 50%**

Dear Ms. Lemont:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7 (c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). Hydro International has requested an MTD Laboratory Certification for the First Defense® HC Stormwater Treatment Device.

The project falls under the "Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advance Technology" dated January 25, 2013. The applicable protocol is the "New Jersey Laboratory Testing Protocol to Assess Total Suspended Solids Removal by a Hydrodynamic Sedimentation Manufactured Treatment Device" dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix (dated February 2016) for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

**The NJDEP certifies the use of the First Defense® HC Stormwater Treatment Device by Hydro International at a TSS removal rate of 50% when designed, operated and maintained in accordance with the information provided in the Verification Appendix and the following conditions:**

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5.

2. The First Defense® HC Stormwater Treatment Device shall be installed using the same configuration reviewed by NJCAT and shall be sized in accordance with the criteria specified in item 6 below.
3. This First Defense® HC Stormwater Treatment Device cannot be used in series with another MTD or a media filter (such as a sand filter) to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual which can be found on-line at [www.njstormwater.org](http://www.njstormwater.org).
5. The maintenance plan for a site using the First Defense® HC Stormwater Treatment Device shall incorporate, at a minimum, the maintenance requirements noted in the attached document. However, it is recommended to review the maintenance website at [http://www.hydro-int.com/UserFiles/downloads/FD\\_O%2BM\\_F1512.pdf](http://www.hydro-int.com/UserFiles/downloads/FD_O%2BM_F1512.pdf) for any changes to the maintenance requirements.
6. Sizing Requirements:

The example below demonstrates the sizing procedure for the First Defense® HC Stormwater Treatment Device:

Example: A 0.25 acre impervious site is to be treated to 50% TSS removal using a First Defense® HC Stormwater Treatment Device. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs.

#### Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was based on the following:

time of concentration = 10 minutes

i=3.2 in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)

c=0.99 (curve number for impervious)

$$Q=ciA=0.99 \times 3.2 \times 0.25 = 0.79 \text{ cfs}$$

Given the site runoff is 0.79 cfs and based on Table 1 below, the First Defense® HC Model 4-ft with a MTFR of 1.5 cfs would be the smallest model approved that could be used for this site that could remove 50% of the TSS from the impervious area without exceeding the MTFR.

The sizing table corresponding to the available system models is noted below. Additional specifications regarding each model can be found in the Verification Appendix under Table A-1 and Table A-2 of the NJCAT Verification Report.

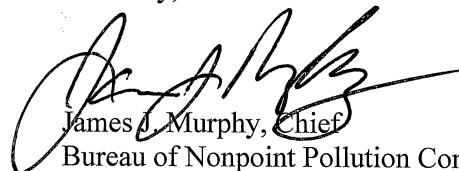

Table 1 First Defense® HC Models

First Defense® Model	Manhole Diameter (ft)	Maximum Treatment Flowrate, MTFR (cfs)
4-ft	4-ft	1.50
6-ft	6-ft	3.38
8-ft	8-ft	6.00

Be advised a detailed maintenance plan is mandatory for any project with a Stormwater BMP subject to the Stormwater Management Rules, N.J.A.C. 7:8. The plan must include all of the items identified in the Stormwater Management Rules, N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of inspection and maintenance equipment and tools, specific corrective and preventative maintenance tasks, indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance of the New Jersey Stormwater Best Management Practices Manual.

If you have any questions regarding the above information, please contact Mr. Titus Magnanao of my office at (609) 633-7021.

Sincerely,

James J. Murphy, Chief  
Bureau of Nonpoint Pollution Control
